

From catalogue presence to artist participation

G Amplify sits within Artist Management. Its first workstream is to identify artists already present in the Goongoonalo catalogue, help them claim their Artist ID and support their first meaningful use.

Permanent loop: each new export enriches existing cases. New evidence can reopen unresolved work; previous research, contacts and claim progress are retained.

Upload once; update the permanent system

System steps run on every file the operator uploads. A completed export is a dated view of the operating system, never a replacement for its historical database.

Import control: input rows = accepted + quarantined + skipped repeats, with one disposition per row. Re-uploading the same evidence creates no extra artists, links or tasks.

One artist case, with all supported aliases

The working unit is a canonical artist case linked to its backend profile ID(s). A song can credit several people, and a person can have several credited roles.

Important distinction: catalogue identity, contact identity and claim authority require separate evidence. Appearing in credits does not prove authority to control a profile.

Find routes through the music

For every artist, build a dossier from the songs that caused the profile to exist. Search outward through actual credits and professional connections, using all relevant channels.

Route record: who may connect us, why, which song supports the link, how to approach them, who owns the action and what result was obtained.

Every name follows the same sequence

Operators work from assigned cases. Proposed starting rule: spend up to 30 focused minutes on initial desk research, then record a precise blocker or escalate. Adjust after the pilot.

Order / action	Required record and exit condition
1. Read existing history	Check claim status, prior searches, attempted routes, latest changes and outstanding follow-ups. Do not restart an old case from zero.
2. Verify the artist dossier	Open the backend profile and linked songs. Confirm that the candidate person matches the catalogue and role; flag ambiguity.
3. Check available direct details	Review authorised internal contacts, official artist/management websites and previously verified details. Log where each detail came from.
4. Inspect song credits	For each relevant song, inspect performers, writers, producers, label and distributor. Start with new evidence and known connections; track which sources are covered.
5. Check professional profiles	Use song titles, credits, roles and release/label details on relevant DSPs, YouTube, SoundCloud and social profiles. Log query, URL and result.
6. Build an introduction route	Check the known-contact register against credited collaborators or organisations. Identify the best introducer and an alternate route.
7. Verify and select the route	Corroborate the contact identity. Reviewer resolves conflicts. Select one route, set owner/due date and preserve the others.
8. Save an outcome	Route ready; identity review; metadata request; waiting for introduction; or waiting for new evidence. Include evidence, blocker, next owner/date and research coverage.

Turn a route into a confirmed conversation

The operating system prepares outreach tasks for the designated G Amplify operator. It records channel, recipient, approved wording, sent time, reply and next action.

Contact success: a verified conversation with the artist or authorised representative. A search, sent message or unanswered introduction is an intermediate result.

Invite, verify and confirm the claim

Use the actual Goongoonalo claim workflow and backend states. Swatantra must map the software states below to the available claim API/export fields before implementation.

Claim KPI: count unique canonical artist cases with verified completed claims. Keep backend profile counts separately when one artist has multiple profiles.

Claimed is the start of participation

The department objective is artist onboarding and use. Proposed activation definition: verified profile access plus one supported, meaningful artist-feature action recorded with evidence.

Report separately: identified, usable route, verified contact, claim submitted, claim completed, first use and continued participation. These are different conversion steps.

New evidence reopens the right cases

Run this automatically after each accepted upload. The system refreshes when a new file is supplied; scheduled backend/API ingestion would be a separate implementation option.

Example: 28,000 artist cases minus 3,000 verified claimed cases = 25,000 not yet claimed. Retain all 25,000 with their individual stages; this is an illustration, not a verified count.

Every case has a clear outcome today

Keep four separate fields: lifecycle stage, task status, work reason and contact preference. Waiting is an explicit stage with a trigger or review date, never a deletion.

Lifecycle stage	Evidence / next-action rule
Unresearched	Accepted artist case; assign the first dossier review.
Identity review	Conflict or insufficient match; named reviewer and missing evidence.
Researching	Operator assigned; checklist progress, time and current source saved.
Waiting for evidence	Checklist exhausted or metadata absent; blocker, tested routes, coverage, last review and future trigger recorded.
Route ready	Verified contact or evidenced introduction path; outreach task due.
Introduction pending	Named intermediary approached; request/reply and follow-up date.
Contact attempted	Message/call logged; no verified conversation yet.
Contact confirmed	Correct person/representative reached; interest and next action saved.
Claim invited / submitted	Link event or real request ID respectively; assistance/review task.
Claim review / claimed	Admin decision pending, or backend completion verified.
Activation pending / activated	First-use task pending, or access plus meaningful use evidenced.
Ongoing ARM / closed	Relationship handover, or reasoned closure such as invalid profile/confirmed duplicate redirect. Retain history.

Work reasons: new artist, new lead, follow-up, metadata gap, technical issue or re-engagement. Task statuses: queued, in progress, waiting, completed, cancelled. Contact preference: allowed, later with date, declined or do-not-contact.

The tables Swatantra needs to build

Use linked tables or equivalent application records. One giant overwritten spreadsheet cannot safely preserve song-level relationships, repeated imports and contact history.

Record / key	Minimum fields and relationship
Artist master / case ID	Canonical name, aliases, backend IDs/URLs, roles, language if known, identity status/evidence, lifecycle, contact preference, owner, next action/date, first/last seen.
Import / batch + row ID	Original file/version, source, export date, type, checksum, uploader/time, raw row, mapped fields, validation and disposition.
Tracks + releases / track ID	Backend track/release IDs, title/version, ISRC if present, label/distributor IDs and source references. Keep conflicting identifiers under review.
Credits / relationship ID	Track + credited person/entity + role + source/version. Many-to-many links; retain rejected or superseded links with reasons.
Identity decisions / decision ID	Candidate cases/profiles, evidence, confirm/separate/defer, reviewer/date, redirects and reversible merge/unmerge history.
Contact directory / contact ID	Person/organisation, channel/address, role/authority evidence, verification/date, preferences and links to cases. Restrict contact data by job role.
Routes / route ID	Target case, ordered song/person/organisation path, evidence references, route state, ranking, last check and prior failed attempts.
Tasks + attempts / task/event ID	Case, owner, step, trigger, due time, action/channel/recipient, result, evidence, next action, actual focused time and status.
Claims + activation / event ID	Backend profile/request IDs, reviewer, submission/approval, claimed snapshot, access evidence, feature/action evidence and ARM handover.
Audit + exports / version ID	Who changed what and when; previous/new values; export cutoff/version, filter, counts and exact contributing case IDs.

One upload enriches several working views

Proposed minimum import contract below. Adapt to the real backend export; absent fields produce explicit limitations or requests rather than fabricated values.

View / contract	What it must contain
Backend input	Stable artist/profile ID, displayed name, track/release ID and credit role/relationship where available. Claim state and profile URLs should be supplied from backend/admin data.
Useful enrichment	ISRC, version, full credited collaborators, label/distributor, official profile identifiers and available contact references. Record unknowns explicitly.
Batch summary	Rows received/accepted/quarantined/skipped; artists created/updated; new tracks/credits; reopened cases; claim changes; rejected matches and errors.
Artist master export	One row per canonical case: source profile IDs, lifecycle, claim and activation flags, contact preference, owner, last evidence change, last action, next action/date and blocker.
Today's operator queue	Assigned case, exact step, why it is queued, evidence changes, selected route, due date, checklist coverage and expected outcome.
Unresolved + reopened views	Never researched; identity conflicts; awaiting metadata; no route; no reply; new lead; claim support. Each view retains history links and next owner/date.
Evidence detail export	Separate sheets/sections for songs/credits, contacts/routes, attempts, tasks, claim/activation evidence, audit and batch exceptions. Join using permanent keys.
Management dashboard	Unique artist funnel; backlog and ageing; stage movement; staff outcomes; overdue tasks; new-lead conversions; claim/activation verified counts; source/route effectiveness.
Export behaviour	Every output has cutoff, version and filter. Reimport is allowed only through controlled editable fields with ID/version checks; exports never replace the database.

Three operators, one shared work queue

The following routine is a proposed pilot design. G Amplify management sets staffing, working hours and outreach capacity; Swatantra implements the controls and reports.

Responsibility	Routine and measurable output
Swatantra / system owner	Implement imports, identity review tools, relationship links, queues, refresh triggers, logs and exports. Ensure repeat uploads and concurrent updates are safe.
G Amplify lead	Assign one accountable owner per case; balance queues; resolve blocked research; review identity/route quality; coordinate claim/admin and ARM support.
Operator / start of day	Check replies, agreed callbacks and overdue tasks first. Review new-lead alerts, then route-ready cases, then unresearched cases. Reserve capacity so untouched artists are not starved.
Operator / research blocks	Follow page 5 in order. Record useful source evidence and focused task time. Escalate after the proposed initial research limit; do not count an open app as work.
Operator / outreach blocks	Make assigned calls/messages/introduction requests; log actual events and responses; help interested artists submit claims; schedule feature guidance.
Operator / end of day	Every worked case has an outcome and next step. Report distinct artists worked, new verified routes, real conversations, claims submitted/verified and first-use actions.
Admin / claim reviewer	Verify claimant authority and exact profile; resolve conflicts; supply trusted backend claim completion evidence. Operators cannot approve their own disputed claims.
Weekly lead review	Review backlog ageing, stalled claims, missed follow-ups, new evidence ignored, incorrect matches and first-use drop-off. Sample successful and waiting cases for evidence quality.
Handover control	Changing operator preserves the case, notes, contacts, open tasks and due dates. No duplicate simultaneous outreach; edits use version checks or locks.

12 songs today; a new connection tomorrow

Illustrative only, based on Sherley's example. The artist name and Joshua connection demonstrate the required software behaviour; these are not verified live catalogue facts.

Pass condition: earlier work is preserved, only five new tracks are added, the new lead is visible, one task is created, and a repeat upload changes none of these counts.

What success must demonstrate

The operating system can guarantee a recorded outcome and next step for each worked case. Artist willingness and conversion cannot be guaranteed by research alone.

Check	Expected result before accepting the software
Annual planning illustration	3 operators x 265 working days = 795 operator-days. 1,000 verified claims require 1.26 per operator-day; 2,000 require 2.52. These are required averages, not forecasts.
Ten-case interpretation	If the intended target is 10 distinct artist cases worked per operator-day, capacity is 7,950 case-days. Cases can recur across days; unique artists will be fewer. Confirm this target in the pilot.
Pilot calibration	Use a proposed four-week pilot to measure research time, usable-route rate, reply rate, verified claims and first-use rate. Set staffing and daily targets from observed conversion and workload.
Import + history tests	Repeat upload creates no extra links/tasks. Corrected input is versioned. Invalid rows are visible. A smaller full export flags absent records without deleting history or assuming claims are revoked.
Identity + route tests	Same-name people stay separate. Wrong matches can be undone. One song can link multiple credited roles. Contact identity and claimant authority remain independently checked.
Refresh + suppression tests	The 12+5 example passes. A newly verified collaborator contact reopens affected old cases. No-change imports do not reopen work. Do-not-contact survives every import.
Claim + activation tests	Sent link does not count as claimed. Submitted is separate from approved. Backend verification controls completed claims. Login alone does not count as meaningful activation.
Ownership + reporting tests	One active owner per case; no duplicate outreach task; operator handover retains history. Every KPI traces to dated evidence and unique case IDs. Waiting cases remain filterable.
Business boundary	This deliverable defines G Amplify identification, claim and activation. The attached MRM royalty-comparison PDF supplies the flowchart format; royalty calculations are outside this workflow.
